AUTHOR: Domsa, A., Palfalvi, A., Filipescu, M., Nicolae, V., Botha, L.

TITLE: Pressing and sintering properties of molybdenum powders

SOURCE: Metalurgia, no. 4, 1964, 156-158

TOPIC TAGS: metallurgical pressing, sintering, arc-cast, molybdenum electrode, powder metallurgy

ABSTRACT: The article deals with pressing and sintering operations of molybdenum powders made from indigenous raw materials. Two methods are used to obtain compact molybdenum: one in which the sintered semifinished products are forged and, possibly, drawn, and one in which sintered molybdenum powder electrodes are melted in vacuum (also called the arc-cast method). As a result of the experiments made, it appears that molybdenum powder made from indigenous raw material has favorable pressing and sintering properties and can be used in powder metallurgy. Orig. art. has: 11 figures and 1 table.

TITLE: Research on the protection of molybdenum through silicification

SOURCE: Metalurgia, no. 4, 1964, 158-162

TOPIC TAGS: Silicification, silicide, silicide layer, molybdenum oxidation, molybdenum protection

ABSTRACT: The article describes various methods tested to protect molybdenum from oxidation. Modern techniques require materials for over 1,000°C., while molybdenum oxidizes beyond tolerance limits at 500° C. It must therefore be effectively protected before it can be used at high temperatures. Several methods were proposed, but only some are valid. Results are presented for methods used to silicify molybdenum, especially in the SiCl_4 and H_2 gaseous phase. Most effective protection is with silicide, especially disilicide. Although silicide layers are brittle when cold, they become far less brittle at high temperatures and they retain their mechanical resistance. They may therefore be used for the protection of heating elements for electric ovens and for that of parts used in high temperature furnaces, turbines, rockets, etc. Orig. art. has: 9 figures, and

46. Magazine stoving in ore mining, especially in respect to the Recak mines - *Magazinfejtés az ércbányászásban, különös tekintettel a recski bányászatra* - A. Gagy Palffy. (Hungarian Journal of Mining - *Idnyászati Lapok* - Vol. 8 (86), 1953, No. 1, pp. 1-18, 21 figs.)

Hungarian Technical Abst.
Vol. 6 No. 1
1954

The magazine method is essentially a room method whereby the cut coal is stored on the spot, clearing away only enough to permit the miner to reach the roof. Special cases of mining practices abroad are mentioned. Before starting production all preparatory work must be completed, after this production can begin simultaneously in all the rooms. The cost of winning amounts to 40% of the entire cost of production. Two variations have been worked out for the employment of this working method in Hungarian mines. According to one variation the first slice coincides with a haulage level, while according to the other it is started between two levels. The importance of the large scale use of roof bolting is emphasized. Slurry obtained from ore dressing is suitable for stope filling. If slurry stowing is not possible due to the lack of damming facilities then the rubbish is poured through chutes into the cavity in which only 25% of the rubbish is leveled by manpower. According to calculations the attainable savings at the Recak mine comes to 25% of the entire mining costs. Further savings can be ensured by rapid drifting and by increased mechanization.

"The Evaluation of Mass X-Ray and Tuberculin Screening Tests on Diabetics."

Budapest, Orvosi Hetilap, Vol 104, No 21, 21 May 63, pages 970-974.

Abstract: [Authors' Hungarian summary] The tb morbidity of diabetics is possibly 3-4 fold of that of the general population in Hungary as well. Inactive tb was found to occur in similar numbers among diabetics and non-diabetics around the sixth decade of life. Diabetic men showed more frequent active tb than diabetic women. No significant difference was seen in the tuberculin reaction of diabetics who had no active tb and healthy individuals of the same age groups. Mass tests among diabetics showed that 3 per cent of them had negative tuberculin reaction. 15 Western, 3 Eastern European references.

Tables 1 Illus. 12

A histological report on 7 out of a group of 13 dogs injected with a suspension of 505 g. of killed and dried tubercle bacilli and 32 g. of homologous brain tissue in a mixture of 50 ml. physiological saline, 140 ml. paraffin and 2 ml. phenol. Subcutaneous injection of 10 ml. twice a week first, and then 5 or 2 ml. once a week produced neurological symptoms in 3 out of the animals. Only one of these showed the complete histological picture of experimental allergic encephalomyelitis one month following the first inoculation. Almost negative histological findings were found in the 6 others surviving 20 days to about 1 yr. after the first inoculation.

"On the Interpretation of 'Perspective Vision'"

Budapest, Magyar Pszichológiai Szemle, Vol 23, No 1-2, 1966, pp 227-239.

Abstract: This article discusses the philosophical and psychological aspects of perspective vision on the basis of some theoretical considerations and experimental data. The theoretical considerations are based on the Marxist-Leninistic interpretation of the factors involved. The experimental data deal mainly with studies on children. Although some so-called modern bourgeois artists doubt the general validity of perspective vision, it is a valid concept nevertheless. Indeed, the development of perspective vision indicates a higher level intellect characteristic of socialistic, realistic creative art. No references.

TITLE: Effect of ^{2,55}hyperoxia on gastric hydrochloric acid secretion in the rat
[This paper was presented at the 29th Meeting of the Hungarian Physiological
Society held in Szeged from 2 to 4 July 1964.]

SOURCE: Academia scientiarum hungaricae. Acta physiologica, v. 26, Supplement,
1965, 26

TOPIC TAGS: rat, hyperoxia, biologic secretion, hydrochloric acid, digestive
system, digestive system disease

ABSTRACT: It has been reported in earlier papers that the development of the SHAY ulcer is completely inhibited by hypoxia and strongly promoted by the inhalation of pure oxygen. In this intensive ulcerogenic action of hyperoxia, an important role was attributed.

Card 1/2

L-14866-66
ACC NR: AT6007405

to the increase in gastric secretion caused by oxygen. Male albino rats weighing 180-220 g were used in the present experiments. The animals were starved for 48 hours, were given water ad libitum, and underwent SHAY's operation under ether anesthesia. Following surgery, the rats were divided into three groups. The first group was exposed to a stream of pure oxygen at 260 mm Hg pressure for 6 hours, the second group to pure oxygen at 310 mm Hg pressure for 6 hours, the third group served as control. After 6 hours, the animals were exsanguinated and were examined as to the volume, free HCl content and total acidity of the gastric juice. According to the results obtained, hyperoxia caused a definite increase in the HCl secretion of the stomach. [JFRS]

Title : Some New Achievements in Investigations of
Changes of the Milk's Fat Content in Cows.

Orig Pub : Zhivotnovodstvo, 1957, No 12, 40-42

Abstract : Thirty to forty g of sodium sulfate per head
were introduced into the ration for cows of
the Black-spotted breed with an average daily
milk yield of 11-12 kg and a fat content of
3.51 percent. With this additional feeding,
the content of fat in milk amounted during the
first 5-day period to 3.95 percent, during
the second 5-day period to 4.05 percent, and

Title : Course and Nature of Chronic Hematuria in Cattle

Orig Pub: Inform. byul. Nauk.-dosl. in-t sel'skoyobstva i
tvorinnitstva sakhidn. rayoniv URSR, 1956, vip.1, 35-36

Abstract: It is shown that the causative agent of the disease
is a live organism which belongs either to fungi
or protozoa, or to bacteria of cellulose fermenta-
tion. Falling into the rumen with feed, this or-
ganism survives there and secretes products of vi-
tal activity which infect the mucosa of the urinary

Card 1/2

32

bladder. The introduction of the contents of the
rumen of sick cows into the rumen of healthy cows
(by means of a rumenotomy) caused the appearance in
their urinary sediment of both cellular elements
of the urinary tract and erythrocytes, the quantity
of which in several cases reached 200-400 in the
field of vision. The introduction of the contents
of the rumen of healthy cows into the rumen of
sick ones decreased hemorrhaging in the latter
and increased their lifespan. Transfer of healthy
cows into an area infected with mastitis led to
the appearance of the first signs of the disease in
them in four to five months. -- A. G. Lomova

Title : On the Etiology of Chronic Hematuria of Cattle.

Orig Pub : Veterinariya, 1957, No 5, 44-46.

Abstract : The authors consider that the soil, water, and feed composition have no influence upon the development of hematuria. This is supported by the fact that the transfer of sick animals to some other place has no effect on the course of disease, and that disease occurs in countries with different soils and different fodder vegetation. According to the authors' opinion, the etiological agent of hematuria of cattle is to be looked for in some microorganisms of the soil. It is possible that these
